(54) Title: PROCESS FOR MAKING PHENOXY BENZAMIDE COMPOUNDS

(I)

(II)

(III)

(IV)

(57) Abstract: A process for making a compound of formula (I), said process comprising a) reaction of a compound of formula (II) with: i) a compound of formula (III) by nucleophilic aromatic substitution of X^2 and ii) a compound of formula (IV) for example by nucleophilic aromatic substitution b) where necessary, conversion of X^1 to a carboxylic acid; and c) coupling of the carboxylic acid group to an appropriate heterocyclic amine; wherein all variables are as defined in the description.

- 1 -

PROCESS FOR MAKING PHENOXY BENZAMIDE COMPOUNDS

This invention relates to an improved chemical process for making compounds which are useful in the treatment or prevention of a disease or medical condition mediated through glucokinase (GLK or GK), leading to a decreased glucose threshold for insulin secretion. Such compounds are predicted to lower blood glucose by increasing hepatic glucose uptake. Such compounds may have utility in the treatment of Type 2 diabetes and obesity. The invention is also related to intermediates useful in the improved chemical process.

In the pancreatic β -cell and liver parenchymal cells the main plasma membrane glucose transporter is GLUT2. Under physiological glucose concentrations the rate at which GLUT2 transports glucose across the membrane is not rate limiting to the overall rate of glucose uptake in these cells. The rate of glucose uptake is limited by the rate of phosphorylation of glucose to glucose-6-phosphate (G-6-P) which is catalysed by glucokinase (GLK) [1]. GLK has a high (6-10mM) K_m for glucose and is not inhibited by physiological concentrations of G-6-P [1]. GLK expression is limited to a few tissues and cell types, most notably pancreatic β -cells and liver cells (hepatocytes) [1]. In these cells GLK activity is rate limiting for glucose utilisation and therefore regulates the extent of glucose induced insulin secretion and hepatic glycogen synthesis. These processes are critical in the maintenance of whole body glucose homeostasis and both are dysfunctional in diabetes [2].

In one sub-type of diabetes, Maturity-Onset Diabetes of the Young Type 2 (MODY-2), the diabetes is caused by GLK loss of function mutations [3, 4]. Hyperglycaemia in MODY-2 patients results from defective glucose utilisation in both the pancreas and liver [5]. Defective glucose utilisation in the pancreas of MODY-2 patients results in a raised threshold for glucose stimulated insulin secretion. Conversely, rare activating mutations of GLK reduce this threshold resulting in familial hyperinsulinism [6, 6a, 7]. In addition to the reduced GLK activity observed in MODY-2 diabetics, hepatic glucokinase activity is also decreased in type 2 diabetics [8]. Importantly, global or liver selective overexpression of GLK prevents or reverses the development of the diabetic phenotype in both dietary and genetic models of the disease [9-12]. Moreover, acute treatment of type 2 diabetics with fructose improves glucose tolerance through stimulation

- 2 -

of hepatic glucose utilisation [13]. This effect is believed to be mediated through a fructose induced increase in cytosolic GLK activity in the hepatocyte by the mechanism described below [13].

Hepatic GLK activity is inhibited through association with GLK regulatory protein (GLKRP). The GLK/GLKRP complex is stabilised by fructose-6-phosphate (F6P) binding to the GLKRP and destabilised by displacement of this sugar phosphate by fructose-1-phosphate (F1P). F1P is generated by fructokinase mediated phosphorylation of dietary fructose. Consequently, GLK/GLKRP complex integrity and hepatic GLK activity is regulated in a nutritionally dependent manner as F6P is dominant in the post-absorptive state whereas F1P predominates in the post-prandial state. In contrast to the hepatocyte, the pancreatic β -cell expresses GLK in the absence of GLKRP. Therefore, β -cell GLK activity is regulated extensively by the availability of its substrate, glucose. Small molecules may activate GLK either directly or through destabilising the GLK/GLKRP complex. The former class of compounds are predicted to stimulate glucose utilisation in both the liver and the pancreas whereas the latter are predicted to act selectively in the liver. However, compounds with either profile are predicted to be of therapeutic benefit in treating Type 2 diabetes as this disease is characterised by defective glucose utilisation in both tissues.

GLK, GLKRP and the K_{ATP} channel are expressed in neurones of the hypothalamus, a region of the brain that is important in the regulation of energy balance and the control of food intake [14-18]. These neurones have been shown to express orectic and anorectic neuropeptides [15, 19, 20] and have been assumed to be the glucose-sensing neurones within the hypothalamus that are either inhibited or excited by changes in ambient glucose concentrations [17, 19, 21, 22]. The ability of these neurones to sense changes in glucose levels is defective in a variety of genetic and experimentally induced models of obesity [23-28]. Intracerebroventricular (icv) infusion of glucose analogues, that are competitive inhibitors of glucokinase, stimulate food intake in lean rats [29, 30]. In contrast, icv infusion of glucose suppresses feeding [31]. Thus, small molecule activators of GLK may decrease food intake and weight gain through central effects on GLK. Therefore, GLK activators may be of therapeutic use in treating eating disorders, including obesity, in addition to diabetes. The hypothalamic effects will be additive or synergistic to the effects of the same compounds acting in the liver and/or pancreas in

- 3 -

normalising glucose homeostasis, for the treatment of Type 2 diabetes. Thus the GLK/GLKRP system can be described as a potential "Diabesity" target (of benefit in both Diabetes and Obesity).

GLK is also expressed in specific entero-endocrine cells where it is believed to control the glucose sensitive secretion of the incretin peptides GIP (glucose-dependent insulinotropic polypeptide) and GLP-1 (Glucagon-Like Peptide-1) from gut K-cells and L-cells respectively (32, 33, 34). Therefore, small molecule activators of GLK may have additional beneficial effects on insulin secretion, b-cell function and survival and body weight as a consequence of stimulating GIP and GLP-1 secretion from these entero-endocrine cells.

In our co-pending applications (WO2005/080359, WO2005/080360, PCT/GB2005/002166 and priority applications GB0423044.7 and GB0423043.9) we have described compounds which are useful as GLK activators, which are of general chemical formula (I).

wherein for example

R^1 is hydroxymethyl, methoxymethyl or methyl;

X is methyl or ethyl;

R^2 is selected from $-C(O)NR^4R^5$, $-SO_2NR^4R^5$, $-S(O)_pR^4$ and HET-2;

HET-1 is an optionally substituted 5- or 6-membered, C-linked heteroaryl ring containing a nitrogen atom in the 2-position;

HET-2 is an optionally substituted 4-, 5- or 6-membered, C- or N-linked heterocyclyl ring containing 1, 2, 3 or 4 heteroatoms;

R^3 is selected from halo, fluoromethyl, difluoromethyl, trifluoromethyl, methyl, methoxy and cyano;

R^4 is selected from hydrogen, (1-4C)alkyl [optionally substituted], (3-6C)cycloalkyl (optionally substituted) and HET-2;

- 4 -

R^5 is hydrogen or (1-4C)alkyl;

or R^4 and R^5 together with the nitrogen atom to which they are attached may form a heterocyclyl ring system;

m is 0 or 1;

5 n is 0, 1 or 2;

provided that when m is 0, then n is 1 or 2;

or a salt, pro-drug or solvate thereof.

10 The compounds of formula (I) are N-heterocyclyl-aryl amides, wherein the aryl ring is 3,5-disubstituted by a substituted alkyl ether and an aryloxy substituent. These compounds have generally been synthesised using reaction sequences such as those illustrated in Schemes 1 and 2 below:

- 5 -

Scheme 1

where X is as defined in Formula (1), P is methyl or a protecting group such as a trialkylsilyl group.

- 6 -

Scheme 2

- 5 The starting material for both of these synthetic routes is methyl(3,5-dihydroxy)benzoate. The order of attaching the various substituents around the phenyl ring has varied, but in both routes illustrated, it has been necessary to use protecting groups (benzyl in Schemes 1 and 2) during the synthetic sequence in order to differentiate between

- 7 -

the two hydroxy groups in the starting material. This inevitably introduces extra synthetic steps with the consequent implications for increased cost per unit weight of final product and increased waste and environmental impact, if the product were to be manufactured on significant scale.

5 Concurrently, compounds with a similar general formula have been published (WO 2004/076420). A route used to these compounds is illustrated in Scheme 3.

Scheme 3

10

However, as shown above, a methoxymethyl protecting group is still utilised in this route.

In order for such compounds to be useful commercially, there is a need to develop one or more short, efficient synthetic routes. We have found that the problems associated with the previous routes as described above can be overcome by using halo substituted starting materials and optionally carboxylic acid precursors instead of an acid or ester as used above. This not only results in a short, efficient route, but avoids the need for several protecting groups.

15

- 8 -

Additionally, certain aspects of the process of the present invention avoid the need for use of Mitsunobu conditions (PPh_3 , diethylazodicarboxylate (DEAD)) which give undesirable by-products (P(O)Ph_3) and use starting materials with a potential explosion hazard (DEAD). Additionally, certain aspects of the process of the present invention avoid the

5 need for use of any heavy metals catalysts, thus minimising undesirable waste and minimising the potential for residue in the product.

According to a first aspect of the invention, there is provided a process for making a compound of formula (I),

10

said process comprising

a) reaction of a compound of formula (II)

15 wherein X^1 is carboxyl or precursor thereof, X^2 is F and X^3 is selected from F, Br and OH; with:

i) a compound of formula (III) by nucleophilic aromatic substitution of X^2 using a suitable base in a suitable solvent,

20

wherein X is as defined for formula (I) below and R^1 is selected from methyl, methoxymethyl and hydroxymethyl (or a protected version thereof); and

- 9 -

ii) a compound of formula (IV) by nucleophilic aromatic substitution using a suitable base in a suitable solvent, or, when X^3 is Br, under conditions suitable for an Ullman ether reaction,

5

(IV)

wherein R^2 , R^3 , m and n are as defined for formula (I) and X^4 is OH when X^3 is F or Br, and X^4 is a leaving group when X^3 is OH;

- b) where necessary, conversion of X^1 into a carboxylic acid; and
- c) coupling of the carboxylic acid group to a compound of formula (V);

10

(V)

and thereafter if necessary:

- i) converting a compound of formula (I) into another compound of formula (I);
 - ii) where R^1 is a protected version of hydroxymethyl, removal of the protecting group;
 - 15 iii) forming a pro-drug; and/or
 - iv) forming a pharmaceutically acceptable salt;
- wherein in a compound of formula (I):
- R^1 is hydroxymethyl, methoxymethyl or methyl;
 - X is methyl or ethyl;
 - 20 R^2 is selected from $-C(O)NR^4R^5$, $-SO_2NR^4R^5$, $-S(O)_pR^4$ and HET-2;
- HET-1 is a 5- or 6-membered, C-linked heteroaryl ring containing a nitrogen atom in the 2-position and optionally 1 or 2 further ring heteroatoms independently selected from O, N and S; which ring is optionally substituted on an available carbon atom, or on a ring nitrogen atom provided it is not thereby quaternised, with 1 or 2 substituents
- 25 independently selected from R^6 ;
- HET-2 is a 4-, 5- or 6-membered, C- or N-linked heterocyclyl ring containing 1, 2, 3 or 4 heteroatoms independently selected from O, N and S, wherein a $-CH_2-$ group can

- 10 -

optionally be replaced by a -C(O)-, and wherein a sulphur atom in the heterocyclic ring may optionally be oxidised to a S(O) or S(O)₂ group, which ring is optionally substituted on an available carbon or nitrogen atom by 1 or 2 substituents independently selected from R⁷;

5 R³ is selected from halo, fluoromethyl, difluoromethyl, trifluoromethyl, methyl, methoxy and cyano;

R⁴ is selected from hydrogen, (1-4C)alkyl [optionally substituted by 1 or 2 substituents independently selected from HET-2, -OR⁵, -SO₂R⁵, (3-6C)cycloalkyl (optionally substituted with 1 group selected from R⁷) and -C(O)NR⁵R⁵], (3-6C)cycloalkyl (optionally substituted with 1 group selected from R⁷ and HET-2;

R⁵ is hydrogen or (1-4C)alkyl;

or R⁴ and R⁵ together with the nitrogen atom to which they are attached may form a heterocyclyl ring system as defined by HET-3;

15 R⁶ is independently selected from (1-4C)alkyl, halo, hydroxy(1-4C)alkyl, (1-4C)alkoxy(1-4C)alkyl, (1-4C)alkylS(O)p(1-4C)alkyl, amino(1-4C)alkyl, (1-4C)alkylamino(1-4C)alkyl, di(1-4C)alkylamino(1-4C)alkyl and HET-4;

or, when HET-1 is 2-pyridyl, R⁶ may additionally be carboxy;

R⁷ is selected from -OR⁵, (1-4C)alkyl, -C(O)(1-4C)alkyl, -C(O)NR⁴R⁵, (1-4C)alkoxy(1-4C)alkyl, hydroxy(1-4C)alkyl and -S(O)pR⁵;

20 HET-3 is an N-linked, 4 to 6 membered, saturated or partially unsaturated heterocyclyl ring, optionally containing 1 or 2 further heteroatoms (in addition to the linking N atom) independently selected from O, N and S, wherein a -CH₂- group can optionally be replaced by a -C(O)- and wherein a sulphur atom in the ring may optionally be oxidised to a S(O) or S(O)₂ group; which ring is optionally substituted on an available carbon or nitrogen atom by 1 or 2 substituents independently selected from R⁸; or

25 HET-3 is an N-linked, 7 membered, saturated or partially unsaturated heterocyclyl ring, optionally containing 1 further heteroatom (in addition to the linking N atom) independently selected from O, S and N, wherein a -CH₂- group can optionally be replaced by a -C(O)- group and wherein a sulphur atom in the ring may optionally be oxidised to a S(O) or S(O)₂ group; which ring is optionally substituted on an available carbon or
30 nitrogen atom by 1 or 2 substituents independently selected from R⁸; or

- 11 -

HET-3 is an 6-10 membered bicyclic saturated or partially unsaturated heterocyclyl ring, optionally containing 1 further nitrogen atom (in addition to the linking N atom), wherein a $-\text{CH}_2-$ group can optionally be replaced by a $-\text{C}(\text{O})-$; which ring is optionally substituted on an available carbon or nitrogen atom by 1 substituent selected from hydroxy and R^3 ;

- 5 R^8 is selected from $-\text{OR}^5$, (1-4C)alkyl, $-\text{C}(\text{O})(1-4\text{C})\text{alkyl}$, $-\text{C}(\text{O})\text{NR}^4\text{R}^5$, (1-4C)alkylamino, di(1-4C)alkylamino, HET-3 (wherein said ring is unsubstituted), (1-4C)alkoxy(1-4C)alkyl, hydroxy(1-4C)alkyl and $-\text{S}(\text{O})\text{pR}^5$;

HET-4 is a 5- or 6-membered, C- or N- linked unsubstituted heteroaryl ring containing 1, 2 or 3 ring heteroatoms independently selected from O, N and S;

- 10 p is (independently at each occurrence) 0, 1 or 2;

m is 0 or 1; and

n is 0, 1 or 2;

provided that when m is 0, then n is 1 or 2.

- 15 It will be understood that steps a)i) and ii) may be carried out in either order, with the preferred order depending on the nature of the substituents R^1 to R^3 and X^1 to X^4 , as shown in Scheme 4:

Scheme 4

- 12 -

Certain compounds of formula (VI), (VII) and (VIII) are novel and form separate independent aspects of the invention.

Particular compounds of formula (VI) where X^1 is a precursor to a carboxylic acid include any one or more of:

- 5 3-bromo-5-isopropoxy-benzonitrile;
- 3-bromo-5-(2-methoxy-1-methylethoxy)benzonitrile;
- 3-bromo-5-(2-tert-butoxy-1-methylethoxy)benzonitrile;
- 3-bromo-5-(2-benzyloxy-1-methylethoxy)benzonitrile;
- 3-bromo-5-(2-(triphenylmethyl)oxy-1-methylethoxy)benzonitrile;
- 10 3-bromo-5-(2-tetrahydropyranyloxy-1-methylethoxy)benzonitrile; and
- 3-bromo-5-(2-allyloxy-1-methylethoxy)benzonitrile.

Further particular compounds of formula (VI) where X^1 is a precursor to a carboxylic acid include any one or more of:

- 3-bromo-5-(2-methoxy-1-ethylethoxy)benzonitrile;
- 15 3-bromo-5-(2-tert-butoxy-1-ethylethoxy)benzonitrile;
- 3-bromo-5-(2-benzyloxy-1-ethylethoxy)benzonitrile;
- 3-bromo-5-(2-(triphenylmethyl)oxy-1-ethylethoxy)benzonitrile;
- 3-bromo-5-(2-tetrahydropyranyloxy-1-ethylethoxy)benzonitrile; and
- 3-bromo-5-(2-allyloxy-1-ethylethoxy)benzonitrile.

- 20 Particular compounds of formula (VI) where X^1 is a carboxylic acid include any one or more of:

- 3-bromo-5-isopropoxy-benzoic acid;
- 3-bromo-5-(2-methoxy-1-methylethoxy)benzoic acid;
- 3-bromo-5-(2-tert-butoxy-1-methylethoxy)benzoic acid;
- 25 3-bromo-5-(2-benzyloxy-1-methylethoxy)benzoic acid;
- 3-bromo-5-(2-(triphenylmethyl)oxy-1-methylethoxy)benzoic acid;
- 3-bromo-5-(2-tetrahydropyranyloxy-1-methylethoxy)benzoic acid; and
- 3-bromo-5-(2-allyloxy-1-methylethoxy)benzoic acid.

- Further particular compounds of formula (VI) where X^1 is a carboxylic acid include
- 30 any one or more of:

- 3-bromo-5-(2-methoxy-1-ethylethoxy)benzoic acid;
- 3-bromo-5-(2-tert-butoxy-1-ethylethoxy)benzoic acid;

- 13 -

3-bromo-5-(2-benzyloxy-1-ethylethoxy)benzoic acid;
3-bromo-5-(2-(triphenylmethyl)oxy-1-ethylethoxy)benzoic acid;
3-bromo-5-(2-tetrahydropyranyloxy-1-ethylethoxy)benzoic acid; and
3-bromo-5-(2-allyloxy-1-ethylethoxy)benzoic acid.

5 Further particular compounds of formula (VI) include the above particular compounds as single enantiomers, particularly the (1S) enantiomers.

A particular compound of formula (VII) is 3-fluoro-5-[4-(methanesulfonyl)phenoxy]benzonitrile.

Particular compounds of formula (VIII) are:

10 3-[(1S)-2-methoxy-1-methylethoxy]-5-[4-(methylsulfonyl) phenoxy] benzonitrile [and the racemic version which is also written as 3-(4-methanesulfonyl-phenoxy)-5-(2-methoxy-1-methyl-ethoxy)benzonitrile];
3-[(1S)-2-methoxy-1-methylethoxy]-5-[4-(methylsulfonyl) phenoxy]benzoic acid [and the racemic version which is also written as 3-(4-methanesulfonyl-phenoxy)-5-(2-methoxy-1-methyl-ethoxy)benzoic acid];
15 3-[(1S)-2-*tert*-butoxy-1-methylethoxy]-5-[4-(methylsulfonyl)phenoxy]benzonitrile; and
3-[(1S)-2-*tert*-butoxy-1-methylethoxy]-5-[4-(methylsulfonyl)phenoxy]benzoic acid.

Further particular compounds of the formula (VIII) include any one or more of:

3-[isopropoxy]-5-[4-(methylsulfonyl)phenoxy]benzonitrile;
20 3-[isopropoxy]-5-[4-(methylsulfonyl)phenoxy]benzoic acid;
3-[(1S)-2-benzyloxy-1-methylethoxy]-5-[4-(methylsulfonyl)phenoxy]benzonitrile;
3-[(1S)-2-benzyloxy-1-methylethoxy]-5-[4-(methylsulfonyl)phenoxy]benzoic acid;
3-[(1S)-2-triphenylmethyloxy-1-methylethoxy]-5-[4-(methylsulfonyl)phenoxy]benzonitrile;
25 3-[(1S)-2-triphenylmethyloxy-1-methylethoxy]-5-[4-(methylsulfonyl)phenoxy]benzoic acid;
3-[(1S)-2-tetrahydropyranyloxy-1-methylethoxy]-5-[4-(methylsulfonyl)phenoxy]benzonitrile;
3-[(1S)-2-tetrahydropyranyloxy-1-methylethoxy]-5-[4-(methylsulfonyl)phenoxy]benzoic acid;
30 3-[(1S)-2-allyloxy-1-methylethoxy]-5-[4-(methylsulfonyl)phenoxy]benzonitrile; and
3-[(1S)-2-allyloxy-1-methylethoxy]-5-[4-(methylsulfonyl)phenoxy]benzoic acid.

- 14 -

A further particular compound of the formula (VIII) is
3-[hydroxy]-5-[4-(methylsulfonyl)phenoxy]benzoic acid.

A particular compound of formula (I) (protected version) is 3-[(1*S*)-2-*tert*-butoxy-1-methylethoxy]-*N*-(1-methyl-1*H*-pyrazol-3-yl)-5-[4-(methylsulfonyl)phenoxy]benzamide.

5

Suitable values for protecting groups used to protect a hydroxymethyl group in R¹ are any of those known in the art for protecting primary alcohol (see for example "Protective groups in Organic Chemistry" 2nd Edition, TW Greene and PGM Wuts, 1991). Compounds of formula (II) containing such protecting groups can be made by methods known in the art from the commercially available propanediol starting materials, for example when X is methyl:

Further suitable values for protecting groups used to protect a hydroxymethyl group in R¹ are *t*-butyl, benzyl, trityl (triphenylmethyl) and tetrahydropyran-2-yl; such that the preferred compounds of formula (III) are:

15

A further suitable protecting group is an allyl ether.

In one aspect, the *tert*-butyl ether: is a preferred protecting group.

These protecting groups may be removed at a convenient moment in the synthetic sequence by methods known in the art. For example, a benzyl group may be removed by hydrogenation. A trityl group or a *tert*-butyl group may be removed by treatment with acid. Suitable acids or acidic conditions for removal of a *tert*-butyl group are, for example, treatment with hydrochloric acid in methanol, or treatment with amberlyst resin, or treatment with formic acid.

20

- 15 -

Suitable values for X^1 as a carboxylic acid precursor are $-\text{CO}_2(1-4\text{C})\text{alkyl}$, $-\text{CHO}$, $-\text{CH}_2\text{OP}$ (where P is a suitable protecting group), cyano, trifluoromethyl, methyl and halo.

Further suitable values are $-\text{CO}_2\text{Et}$, cyano and trifluoromethyl.

Preferred values are cyano and trifluoromethyl, particularly cyano.

5

Suitable conditions for the process steps a) to c) are given below:

Process step a) i) Suitable solvents for nucleophilic aromatic substitution reactions are known in the art (see for example Advanced Organic Chemistry, M B Smith & J March (eds), 2001, 5th Edition, Chapter 13, pg 850); generally a polar aprotic solvent is suitable, for example dimethylformamide (DMF), *N*-methylpyrrolidinone (NMP), dimethylsulfoxide (DMSO) or dimethylacetamide (DMA). Suitable bases are any of those known in the art for such reactions and include, for example, inorganic bases such as potassium carbonate, sodium carbonate, sodium hydride and organic bases such as lithium hexamethyldisilazide.

15 More suitably the solvent is DMF and the base is potassium carbonate.

Process step a) ii) Suitable conditions for this reaction when X^3 is F and X^4 is OH, are generally those described above for step a) i). More suitably, the solvent is DMF and the base is lithium hexamethyldisilazide.

20 When $X^3 = \text{Br}$, the reaction is an Ullman reaction; such reactions and the conditions required to carry them out are well known in the art (see for example K Kunz, U Scholz, D Ganzer, *Synlett*, 2003, 2428-2439, G Mann, C Incarvito, A L Rheingold & J Hartwig, *J. Am. Chem. Soc.*, 1999, 121, 3224-3225 and A Aranyos, D W Old, A Kiyomori, J P Wolfe, J P Sadighi & S L Buckwald, *J. Am. Chem. Soc.*, 1999, 121, 4369-4378).

25 Generally, suitable conditions are use of a high boiling solvent for example toluene, 1,4-dioxane or DMSO, using a copper or palladium catalyst, for example copper, copper (I) chloride, copper (I) bromide, copper (I) iodide, copper (II) chloride, copper (II) bromide, copper (II) iodide, copper (II) oxide, palladium (II) acetate or bisdibenzylideneacetone palladium (0), a ligand for the catalyst for example 1,10-phenanthroline, neocuprine, a 1,3-diketone, racemic-2-(di-*t*-butylphosphino)-1,1'-binaphthyl, 2-(di-*t*-butylphosphino)biphenyl or 1,1'-bis(di-*t*-butylphosphino)ferrocene, and

30

- 16 -

a base for example, inorganic bases such as potassium carbonate, cesium carbonate and organic bases such as sodium *tert*-butoxide to deprotonate the phenol.

For example the reaction may be conducted in NMP, using copper (I) chloride as catalyst, 2,2,6,6-tetramethyl-3,5-heptanedione as ligand and cesium carbonate as base.

5 When $X^3 = OH$, and X^4 is a leaving group, the nucleophilic aromatic substitution reaction is similarly carried out in a suitable solvent (normally a polar aprotic) such as DMF, NMP, DMSO or DMA using a base such as potassium carbonate, sodium carbonate or sodium hydride to deprotonate the phenol. Suitable values for X^4 as a leaving group, are for example halo, mesylate and tosylate. More suitably, X^4 is a halo, preferably fluoro.

10

Process step b) Suitable conditions, where necessary, for conversion of X^1 to a carboxylic acid are as follows:

X^1 is $-CO_2(1-4C)alkyl$: hydrolysis in aqueous acid or base;

X^1 is $-CHO$: oxidation using for example silver (I) oxide, sodium tungstate/hydrogen
15 peroxide;

X^1 is $-CH_2OP$: deprotection (conditions vary depending on protecting group use and are well known in the art) and oxidation using, for example, manganese (IV) oxide, sodium tungstate/hydrogen peroxide,

X^1 is CN : hydrolysis using aqueous or organic solution of an acid or base (for example
20 aqueous hydrochloric acid or aqueous sodium hydroxide solution)

X^1 is trifluoromethyl: strong acid for example concentrated sulfuric acid

X^1 is methyl: oxidation using for example potassium permanganate

X^1 is halogen: carboxylation, typically using a strong base (for example *n*-butyl lithium) and carbon dioxide

25

It will be understood that alternatives to the above illustrative conditions, which are well known in the art, may be used, particularly where the skilled person would understand that alternatives would be preferred due to the nature of the substituents present in the compound.

Preferably, $X^1 = CN$ and the reaction is carried out using sodium hydroxide as the
30 base in 10% water in ethanol as the solvent.

It will be understood that the resulting acid may be isolated as the free acid, or as a salt of the acid, depending on the conditions used. A salt may be used directly in the next

step of the process, or may be converted (for example in situ) to the free acid, using conditions well known in the art.

Particular salts of compounds of formula (VIII) where X^1 is a carboxylic acid may be alkali metal salts, alkaline earth metal salts or salts with organic bases, such as amines.

- 5 Particular examples are the morpholine and tert-butylamine salts of 3-[(1*S*)-2-*tert*-butoxy-1-methylethoxy]-5-[4-(methylsulfonyl)phenoxy]benzoic acid, more particularly the tert-butylamine salt.

- Process step c) suitable conditions for coupling a carboxylic acid derivative to the
10 heterocyclic amine derivative of formula (V) are well known in the art, for example,
(i) using an appropriate coupling reaction, such as a carbodiimide coupling reaction performed with 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (EDAC) in the presence of dimethylaminopyridine (4-DMAP) in a suitable solvent such as DCM, chloroform or DMF at room temperature; or alternatively with carbonyldiimidazole (CDI)
15 in a suitable solvent such as THF at room temperature; or
(ii) reaction in which the carboxylic group is activated to an acid chloride by reaction with oxalyl chloride in the presence of a suitable solvent such as DCM, and where necessary catalytic amount of DMF. The acid chloride can then be reacted with a compound of formula (V) in the presence of a base, such as triethylamine or pyridine, in a
20 suitable solvent such as DCM or pyridine at a temperature between 0°C and 80°C.

Preferred conditions for process c) are carbonyldiimidazole (CDI) in a suitable solvent such as THF at room temperature.

- For examples of protecting groups known in the art (as well as means of formation and eventual deprotection), see T.W. Greene and P.G.M. Wuts, "Protective Groups in
25 Organic Synthesis", Third Edition, John Wiley & Sons, New York, 1999.

In a further aspect of the invention, there is provided each individual step of the process described above; that is each of the conversions of compounds of formula (II) to (VI), (II) to (VII), (VI) to (VIII) and (VII) to (VIII) is provided as an individual independent aspect of the invention.

- 30 In an alternative aspect of the invention, when X^1 is CN, step b) comprises a partial hydrolysis of CN to $-CONH_2$, and step c) then comprises coupling to a halo-heterocyclic

- 18 -

derivative of formula (IX), wherein halo is suitably chloro, bromo or iodo; using palladium or nickel catalysis.

5

In a further alternative aspect of the invention, X^2 is hydroxy, and step a)i) is carried out using a compound of formula (X):

- 10 where X is as hereinbefore defined for a compound of formula (III), and LG is a leaving group such as halo, mesylate or tosylate. It will be appreciated that this nucleophilic substitution reaction causes inversion of the stereochemistry at the chiral centre present in the compound of formula (X). Suitable conditions for such reactions include the use of polar aprotic solvents such as DMF, NMP, DMSO or DMA, and a base, for example an
- 15 inorganic base such as potassium carbonate, sodium carbonate or sodium hydride. For general information on such S_N2 reactions, see for example Advanced Organic Chemistry, M B Smith & J March (eds), 2001, 5th Edition, Chapter 10, p 389.

In one aspect of the invention, X^3 is selected from F and OH. In a further aspect, X^3 is F.

- 20 In one aspect the compound of formula (II) is 3-hydroxy-5-trifluoromethyl-fluorobenzene.

In another aspect the compound of formula (II) is 3-fluoro-5-cyano-bromobenzene.

In a further aspect the compound of formula (II) is 3,5-difluorobenzonitrile.

- In another aspect, step a)i) is carried out before a)ii); that is the sequence as shown
- 25 in Scheme 4 is (II)→(VI)→(VIII), as illustrated below:

- 19 -

In another aspect, step a)ii) is carried out before a)i); that is the sequence as shown in Scheme 4 is (II)→(VII)→(VIII), as illustrated below:

5

In a preferred aspect of the invention, the compound of formula (II) is 3,5-difluorobenzonitrile and step a)ii) is carried out before a)i).

- In a further aspect of the invention, there is provided a process for making a compound of formula (Ib) [illustrated in Scheme 5], said process comprising:
- i) reaction of difluorobenzonitrile (IIa) with 4-methanesulfonylphenol to give the compound of formula (VIIa);
 - (ii) reaction of the compound of formula (VIIa) with the compound of formula (IIIa) (wherein R^{1a} is methoxymethyl, hydroxymethyl or a protected version thereof) to give the compound of formula (VIIIa);
 - (iii) hydrolysis of the nitrile to give the compound of formula (VIIIb); reaction with a heterocyclic amine to give the compound of formula (Ib);
- and thereafter if necessary:
- i) converting a compound of formula (Ib) into another compound of formula (Ib);
 - ii) where R^{1a} is a protected version of hydroxymethyl, removal of the protecting group;
 - iii) forming a pro-drug; and/or

20

- 20 -

iv) forming a pharmaceutically acceptable salt;

Scheme 5

5 In this aspect of the invention suitably:

R^{1a} is methoxymethyl or tertbutoxymethyl (as a protected version of hydroxymethyl);

HET-1 is pyrazolyl, optionally substituted with (1-4C)alkyl; and/or

the compound (VIIIb) is isolated as a salt;

10

In a further aspect of the invention there is provided a process as shown in Scheme 5, wherein the compound of formula (Ib), wherein R^{1a} is methoxymethyl or tertbutoxymethyl, is subsequently converted to a compound of formula (Ib) wherein R^{1a} is hydroxymethyl.

15

In one embodiment of this aspect, the compound of formula (VIIIb) is converted to the compound of formula (Ib) (wherein R^{1a} is hydroxymethyl) without isolation of the intermediate compound of formula (Ib) (wherein R^{1a} is methoxymethyl or tertbutoxymethyl).

Examples of conversions of a compound of Formula (I) into another compound of Formula (I), well known to those skilled in the art, include functional group interconversions such as hydrolysis, oxidation or reduction, and/or further functionalisation by standard reactions such as amide or metal-catalysed coupling, or nucleophilic displacement reactions.

5 It will be appreciated that, under some conditions for the conversion of one compound of formula (I) or (Ib) into another compound of formula (I) or (Ib), or under conditions for removal of a protecting group from a protected version of a compound of formula (I) or (Ib), a salt may be formed. This salt may then be used as the final desired compound, or may be converted to the free form of the compound of formula (I) or (Ib), or may be converted to an
10 alternative salt form, as required, by methods known in the art. Such a process is illustrated in the accompanying examples.

It will be appreciated that some of the intermediates described herein may themselves have activity as activators of GLK and are thus presented as an independent aspect of the invention. It will further be appreciated that certain intermediates described herein may also be
15 metabolites formed in vivo by dosing of a compound of formula (I) or (Ib) to a warm-blooded animal, such as a human.

The compounds of the invention may be administered in the form of a pro-drug. A pro-drug is a bioprecursor or pharmaceutically acceptable compound being degradable in the body to produce a compound of the invention (such as an ester or
20 amide of a compound of the invention, particularly an in-vivo hydrolysable ester). Various forms of prodrugs are known in the art. For examples of such prodrug derivatives, see:

- a) Design of Prodrugs, edited by H. Bundgaard, (Elsevier, 1985) and Methods in Enzymology, Vol. 42, p. 309-396, edited by K. Widder, *et al.* (Academic Press, 1985);

The contents of the above cited documents are incorporated herein by reference.

- 22 -

Examples of pro-drugs are as follows. An in-vivo hydrolysable ester of a compound of the invention containing a carboxy or a hydroxy group is, for example, a pharmaceutically-acceptable ester which is hydrolysed in the human or animal body to produce the parent acid or alcohol. Suitable pharmaceutically-acceptable esters for carboxy include C₁ to C₆alkoxymethyl esters for example methoxymethyl, C₁ to C₆alkanoyloxymethyl esters for example pivaloyloxymethyl, phthalidyl esters, C₃ to C₈cycloalkoxycarbonyloxyC₁ to C₆alkyl esters for example 1-cyclohexylcarbonyloxyethyl; 1,3-dioxolen-2-onylmethyl esters, for example 5-methyl-1,3-dioxolen-2-onylmethyl; and C₁₋₆alkoxycarbonyloxyethyl esters.

An in-vivo hydrolysable ester of a compound of the invention containing a hydroxy group includes inorganic esters such as phosphate esters (including phosphoramidic cyclic esters) and α -acyloxyalkyl ethers and related compounds which as a result of the in-vivo hydrolysis of the ester breakdown to give the parent hydroxy group/s. Examples of α -acyloxyalkyl ethers include acetoxymethoxy and 2,2-dimethylpropionyloxy-methoxy. A selection of in-vivo hydrolysable ester forming groups for hydroxy include alkanoyl, benzoyl, phenylacetyl and substituted benzoyl and phenylacetyl, alkoxycarbonyl (to give alkyl carbonate esters), dialkylcarbamoyl and N-(dialkylaminoethyl)-N-alkylcarbamoyl (to give carbamates), dialkylaminoacetyl and carboxyacetyl.

A suitable pharmaceutically-acceptable salt of a compound of the invention is, for example, an acid-addition salt of a compound of the invention which is sufficiently basic, for example, an acid-addition salt with, for example, an inorganic or organic acid, for example hydrochloric, hydrobromic, sulphuric, phosphoric, trifluoroacetic, citric or maleic acid. In addition a suitable pharmaceutically-acceptable salt of a benzoxazinone derivative of the invention which is sufficiently acidic is an alkali metal salt, for example a sodium or potassium salt, an alkaline earth metal salt, for example a calcium or magnesium salt, an ammonium salt or a salt with an organic base which affords a physiologically-acceptable cation, for example a salt with methylamine, dimethylamine, trimethylamine, piperidine, morpholine or tris-(2-hydroxyethyl)amine.

In this specification the generic term "alkyl" includes both straight-chain and branched-chain alkyl groups. However references to individual alkyl groups such as "propyl" are specific for the straight chain version only and references to individual

- 23 -

branched-chain alkyl groups such as *t*-butyl are specific for the branched chain version only. For example,

“(1-4C)alkyl” includes methyl, ethyl, propyl, isopropyl and *t*-butyl. An analogous convention applies to other generic terms. For the avoidance of doubt, reference to the
5 group HET-1 containing a nitrogen in the 2-position, is intended to refer to the 2-position relative to the amide nitrogen atom to which the group is attached.

Suitable examples of HET-1 as a 5- or 6-membered, C-linked heteroaryl ring as hereinbefore defined, include thiazolyl, isothiazolyl, thiadiazolyl, pyridyl, pyrazinyl, pyridazinyl, pyrazolyl, imidazolyl, pyrimidinyl, oxazolyl, isoxazolyl, oxadiazolyl and
10 triazolyl.

It will be understood that HET-2 can be a saturated, or partially or fully unsaturated ring.

Suitable examples of HET-2 include azetidiny, furyl, thienyl, thiazolyl, isothiazolyl, thiadiazolyl, pyridyl, pyrazinyl, pyridazinyl, pyrazolyl, imidazolyl,
15 pyrimidinyl, oxazolyl, isoxazolyl, oxadiazolyl, morpholino, morpholinyl, piperidinyl, piperazinyl, morpholinyl, thiomorpholinyl, pyrrolyl, pyrrolidinyl, pyrrolidinonyl, 2,5-dioxopyrrolidinyl, 1,1-dioxotetrahydrothienyl, 2-oxoimidazolidinyl, 2,4-dioxoimidazolidinyl, 2-oxo-1,3,4-(4-triazolinyl), 2-oxazolidinonyl, 2-oxotetrahydrofuranlyl, tetrahydrofuranlyl, tetrahydropyranyl, 1,1-dioxothiomorpholino, 1,3-dioxolanyl, 1,2,4-triazolyl, 1,2,3-triazolyl, pyranlyl, and 4-pyridonyl.
20

It will be understood that HET-2 may be linked by any appropriate available C or N atom, therefore for example, for HET-2 as “imidazolyl” includes 1-, 2-, 4- and 5-imidazolyl.

Suitable examples of HET-3 as a 4-6 membered saturated or partially unsaturated
25 heterocyclic ring are morpholino, piperidinyl, piperazinyl, pyrrolidinyl and azetidiny.

A suitable example of HET-3 as a 7-membered saturated or partially unsaturated heterocyclic ring is homopiperazinyl, homo-morpholino, homo-thiomorpholino (and versions thereof wherein the sulfur is oxidised to an SO or S(O)₂ group) and homo-piperidinyl.

30 Suitable examples of HET-3 as an 6-10 membered bicyclic heterocyclic ring are bicyclic saturated or partially unsaturated heterocyclyl ring such as those illustrated by the

structures shown below (wherein the dotted line indicates the point of attachment to the rest of the molecule):

Suitable examples of HET-4 are furyl, pyrrolyl, thienyl, thiazolyl, isothiazolyl, thiadiazolyl, pyridyl, pyrazinyl, pyridazinyl, pyrazolyl, imidazolyl, pyrimidinyl, oxazolyl, isoxazolyl and triazolyl.

It will be appreciated that, where definitions of heterocyclyl groups HET-1 to HET-4 encompass heteroaryl rings which may be substituted on nitrogen, such substitution may not result in charged quaternary nitrogen atoms. It will be appreciated that the definitions of HET-1 to HET-4 are not intended to include any O-O, O-S or S-S bonds. It will be appreciated that the definitions of HET-1 to HET-4 are not intended to include unstable structures.

Examples of (1-4C)alkyl include methyl, ethyl, propyl, isopropyl, butyl and tert-butyl; examples of (3-6C)cycloalkyl include cyclopropyl, cyclobutyl, cyclopentyl and

- 25 -

cyclohexyl; examples of **halo** include fluoro, chloro, bromo and iodo; examples of **hydroxy(1-4C)alkyl** include hydroxymethyl, 1-hydroxyethyl, 2-hydroxyethyl, 2-hydroxypropyl, 3-hydroxypropyl, 1-hydroxyisopropyl and 4-hydroxybutyl; examples of **(1-4C)alkoxy(1-4C)alkyl** include methoxymethyl, ethoxymethyl, tert-butoxymethyl, 2-methoxyethyl, 2-ethoxyethyl, methoxypropyl, 2-methoxypropyl and methoxybutyl;

5 examples of **(1-4C)alkylS(O)p(1-4C)alkyl** include methylsulfinylmethyl, ethylsulfinylmethyl, ethylsulfinylethyl, methylsulfinylpropyl, methylsulfinylbutyl, methylsulfonylmethyl, ethylsulfonylmethyl, ethylsulfonylethyl, methylsulfonylpropyl, methylsulfonylbutyl, methylthiomethyl, ethylthiomethyl, ethylthioethyl, methylthiopropyl,

10 and methylthiobutyl; examples of **amino(1-4C)alkyl** include aminomethyl, aminoethyl, 2-aminopropyl, 3-aminopropyl, 1-aminoisopropyl and 4-aminobutyl; examples of **(1-4C)alkylamino(1-4C)alkyl** include (N-methyl)aminomethyl, (N-ethyl)aminomethyl, 1-((N-methyl)amino)ethyl, 2-((N-methyl)amino)ethyl, (N-ethyl)aminoethyl, (N-methyl)aminopropyl, and 4-((N-methyl)amino)butyl; examples of **di(1-4C)alkylamino(1-**

15 **4C)alkyl** include dimethylaminomethyl, methyl(ethyl)aminomethyl, methyl(ethyl)aminoethyl, (N,N-diethyl)aminoethyl, (N,N-dimethyl)aminopropyl and (N,N-dimethyl)aminobutyl; examples of **(1-4C)alkylamino** include methylamino, ethylamino, propylamino, isopropylamino, butylamino and tert-butylamino; examples of **di(1-4C)alkylamino** include dimethylamino, methyl(ethyl)amino, diethylamino,

20 dipropylamino, di-isopropylamino and dibutylamino; examples of **-C(O)(1-4C)alkyl** include methylcarbonyl, ethylcarbonyl, propylcarbonyl and tert-butyl carbonyl.

In a further aspect of the invention, there is provided a compound of formula (I) as hereinbefore defined wherein:

- R¹ is hydroxymethyl;
- 25 X is methyl or ethyl, preferably methyl;
- HET-1 is pyrazolyl, thiazolyl or thiadiazolyl, and HET-1 is optionally substituted with methyl or ethyl;
- R³ is fluoro or chloro;
- m is 1 and n is 0 or 1;
- 30 R² is selected from methylsulfonyl, azetidiny carbonyl, dimethylaminocarbonyl, ethylsulfonyl, dimethylaminosulfonyl and pyrrolidinylcarbonyl;
- or a salt, pro-drug or solvate thereof.

- 26 -

In a further aspect of the invention, there is provided a compound of formula (I) as hereinbefore defined wherein:

R¹ is hydroxymethyl;

X is methyl or ethyl;

5 HET-1 is pyrazolyl, thiazolyl or thiadiazolyl, and HET-1 is optionally substituted with methyl or ethyl;

R³ is fluoro or chloro;

m is 1 and n is 0 or 1;

R² is selected from azetidinyldicarbonyl and pyrrolidinylcarbonyl;

10 or a salt, pro-drug or solvate thereof.

In a further aspect of the invention, there is provided a compound of formula (I) as hereinbefore defined wherein:

R¹ is hydroxymethyl;

X is methyl or ethyl, preferably methyl;

15 HET-1 is pyrazolyl, thiazolyl or thiadiazolyl, and HET-1 is optionally substituted with methyl or ethyl;

R³ is fluoro or chloro;

m is 1 and n is 0 or 1;

R² is methylsulfonyl;

20 or a salt, pro-drug or solvate thereof.

In a further aspect of the invention, the compound of formula (I) is a compound of formula (Ia)

Formula (Ia)

25

wherein:

R³ is selected from fluoro, chloro, C₁₋₃alkyl and C₁₋₃alkoxy;

R¹ is selected from methyl and methoxymethyl;

- 27 -

n is 0, 1 or 2;

X is methyl;

or a salt, pro-drug or solvate thereof.

In a further aspect of the invention there is provided a compound of formula (I)
5 obtainable by the processes of the invention. In a particular embodiment of this aspect, said compound of formula (I) is a compound of formula (Ib) and is:

3-[(1S)-2-hydroxy-1-methylethoxy]-N-(1-methyl-1H-pyrazol-3-yl)-5-[4-(methylsulfonyl)phenoxy]benzamide. In a further particular embodiment of this aspect, said compound of formula (I) is a compound of formula (Ib) and is:
10 3-[(1S)-2-methoxy-1-methylethoxy]-N-(1-methyl-1H-pyrazol-3-yl)-5-[4-(methylsulfonyl)phenoxy]benzamide. In a further particular embodiment of this aspect, said compound of formula (I) is a compound of formula (Ib) and is:
3-[(1S)-2-tert-butoxy-1-methylethoxy]-N-(1-methyl-1H-pyrazol-3-yl)-5-[4-(methylsulfonyl)phenoxy]benzamide.

15 The compounds made by the process of the invention are useful as activators of glucokinase (GLK). This activity may be demonstrated by test methods known in the art, for example those given in our patent application WO 03/015774, WO2005/080359 and WO2005/080360. See also Brocklehurst et al, Diabetes 2004, 53, 535-541.

It will be appreciated that methods for, for example purification, of the compounds
20 in the Examples below are illustrative and alternatives may be used where the skilled person would deem them appropriate.

The invention will now be illustrated by the following Examples, in which, unless otherwise stated:

- (i) evaporations were carried out by rotary evaporation in *vacuo* and work-up
25 procedures were carried out after removal of residual solids such as drying agents by filtration;
- (ii) operations were carried out at room temperature, that is in the range 18-25°C and under an atmosphere of an inert gas such as argon or nitrogen;
- (iii) yields are given for illustration only and are not necessarily the maximum
30 attainable;
- (iv) the structures of the end-products were confirmed by nuclear (generally proton) magnetic resonance (NMR) and mass spectral techniques; proton magnetic

- 28 -

resonance chemical shift values were measured on the delta scale and peak multiplicities are shown as follows: s, singlet; d, doublet; t, triplet; m, multiplet; br, broad; q, quartet, quin, quintet;

- (v) intermediates were not generally fully characterised and purity was assessed
5 by thin layer chromatography (TLC), high-performance liquid chromatography (HPLC), infra-red (IR) or NMR analysis; and

(vi) Biotage cartridges refer to pre-packed silica cartridges (from 40g up to 400g), eluted using a biotage pump and fraction collector system; Biotage UK Ltd, Hertford, Herts, UK.

Example 1 – starting from difluorobenzonitrile**Preparation of 3-([(1*S*)-1-(Hydroxymethyl)ethyl]oxy)-*N*-(1-methyl-1*H*-pyrazol-3-yl)-5-[4-(methanesulfonyl)phenoxy]benzamide**

5

3-Fluoro-5-[4-(methanesulfonyl)phenoxy]benzonitrile

- 4-Methanesulfonyl-phenol (7.6 g, 44 mmol) was stirred in dry DMF (61 ml), anhydrous potassium carbonate (9.1g , 66 mmol) was added and the mixture was heated to 130°C for 1 hour. 3,5-Difluoro-benzonitrile (6.1 g, 44 mmol) was added and the mixture was stirred and heated to 130°C for 18 hours. The reaction mixture was cooled to room temperature, water (183 ml) was added, and the resulting precipitate was isolated by filtration (3.0g). The aqueous DMF was extracted with toluene (3 x 122 ml), the toluene extract was washed with water (4 x 122 ml) and the solvent was removed *in vacuo*, to give 5.0g of solid material. This was combined with the precipitate isolated earlier and purified by flash column chromatography (eluent 60% n-hexane 40% ethyl acetate) to give the title product (7.1g, 56% yield) as a white solid.

- 30 -

^1H NMR (400 MHz, CDCl_3) δ : 3.09 (s, 3H), 7.04 (d, 1H), 7.13 (s, 1H), 7.20 (m, 3H), 8.00 (d, 2H)

Alternative Method:

- 5 3,5-Difluorobenzonitrile (23.23 mmol; 3.23 g) was added to a 100ml round bottomed flask followed by anhydrous potassium carbonate (17.42 mmol, 2.43 g), and then extra dry NMP (15.5 ml) and extra dry DMF (2 ml). The temperature was raised to 130°C and the solution stirred until the reaction mixture became dark brown in colour. 4-Methanesulfonyl phenol (11.61 mmol; 2.0 g) dissolved in NMP (2.5 ml) was then added
- 10 by syringe pump over 1 hr and the mixture was stirred at 130°C for 3 hrs. The reaction mixture was cooled to 60°C and toluene (20 ml) was added, followed by water (20 ml). The two layers were separated and the aqueous/NMP/DMF layer was re-extracted with toluene (20 ml). The combined toluene extracts were washed with water (3 x 20 ml). The organic layer was then cooled from 60°C to 20°C over 4hrs, the precipitate was removed
- 15 by filtration, the toluene filtrate was distilled down to low volume (~10 ml) and the residual white slurry was warmed 50°C. *iso*-Hexane (40 ml) was added and the temperature was reduced to 20°C over 4hrs. The product was isolated by filtration (2.81g; 82.7%).

20 **3-(4-Methanesulfonyl-phenoxy)-5-(2-methoxy-1-methyl-ethoxy)benzonitrile**

- NaHMDS (0.63 g, 3.4 mmol) was placed in a 50 ml round bottomed flask (purged with nitrogen), dry DMF (5 ml) was added and the mixture was cooled to 0-5°C.
- 1-Methoxypropan-2-ol (0.31 g, 3.4 mmol) was added (exothermic), the mixture was
- 25 slowly warmed to room temperature and stirred at this temperature for 30 minutes. 3-Fluoro-5-(4-methanesulfonyl-phenoxy) benzonitrile (1.0 g, 3.4 mmol) was dissolved in dry DMF (5 ml) and added to the reaction mixture, which was then stirred and heated to 70°C for 18 hours. The reaction mixture was cooled to room temperature, water was added (30

- 31 -

ml) then the mixture was extracted with toluene (3 x 30 ml). The combined toluene extracts were washed with water (4 x 30 ml) and the solvent was evaporated *in vacuo* to give 1.0g of clear oil, which was purified by flash column chromatography (eluent 60% n-hexane 40% ethyl acetate) to give the title product as a clear oil (0.74g, 60% yield).

- 5 ¹HNMR (400 MHz, CDCl₃) δ: 7.95 (d, 2H), 7.14 (d, 2H), 7.04 (m, 1H), 6.90 (m, 1H), 6.87 (m, 1H), 4.54 (m, 1H), 3.53 (m, 2H), 3.39 (s, 3H), 3.08 (s, 3H), 1.32 (d, 3H)

3-[(1S)-2-methoxy-1-methylethoxy]-5-[4-(methylsulfonyl) phenoxy]benzonitrile

10

- NaHMDS (24.5 mmol; 4.74 g) was charged to a 50 ml round bottomed flask, followed by dry DMF (32.5 ml). The flask was purged with nitrogen, the mixture was cooled to 0-5°C and S-1-methoxypropan-2-ol (22.31 mmol; 2.01 g) was added over 5 minutes keeping the temperature below 6°C. The mixture was held at 0-5°C for 25 minutes and then slowly warmed to room temperature over 35 minutes.

- 3-Fluoro-5-(4-methanesulfonyl-phenoxy)-benzonitrile (22.31 mmol; 6.50 g) was dissolved in dry DMF (32.5 ml) and this was added to the flask containing the anion of S-1-methoxypropan-2-ol. The mixture was heated to 70°C and held at 70°C for 18hrs. Water (20 ml) was added, then sufficient toluene to dissolve the precipitated solid was added. The mixture was extracted further with toluene (3 x 100 ml) and the combined toluene extract was washed with water (3 x 200 ml). The toluene layers were distilled down to low volume *in vacuo* and *iso*-hexane was added (50 ml). The resulting precipitate of the desired product was filtered off, washed with *iso*-hexane (2 x 25 ml) and dried in a vacuum oven at 40°C overnight (6.0 g, 74.4% yield).

3-(4-Methanesulfonyl-phenoxy)-5-(2-methoxy-1-methyl-ethoxy)benzoic acid

3-(4-Methanesulfonyl-phenoxy)-5-(2-methoxy-1-methyl-ethoxy)benzonitrile (0.1 g, 0.27 mmol) was dissolved in ethanol (1.0 ml) and charged to a 5ml round bottomed flask equipped with a condenser. Water (0.2 ml, 11.1 mmol) was added, followed by sodium hydroxide (18.9M in water, 0.2 ml, 3.78 mmol). The reaction mixture was heated to reflux for 18 hours. The reaction mixture was cooled to room temperature, the solvent was evaporated *in vacuo*, the residue was partitioned between water (10 ml) and MTBE (10 ml) and the layers were separated. The aqueous phase was acidified to pH1 with 2M HCl (2.5 ml, 5 mmol) and MTBE (10 ml) was added to extract the product. This MTBE extract was dried over MgSO₄, and then evaporated *in vacuo* to give the title product as a white solid (0.1g, 100% yield).

¹H NMR (400 MHz, CDCl₃) δ: 7.92 (d, 2H), 7.51 (m, 1H), 7.35 (m, 1H), 7.12 (d, 2H), 6.90 (m, 1H), 4.63 (m, 1H), 3.57 (m, 2H), 3.42 (s, 3H), 3.08 (s, 3H), 1.33 (d, 3H).

3-[(1S)-2-Methoxy-1-methylethoxy]-5-[4-(methylsulfonyl)phenoxy]benzoic acid

20

3-[(1S)-2-Methoxy-1-methylethoxy]-5-[4-(methylsulfonyl) phenoxy]benzonitrile (0.1g, 0.27 mmol) was dissolved in ethanol (1.0 ml) and charged to a 5 ml round bottomed flask equipped with condenser and magnetic stirrer. Water (0.2 ml, 11.1 mmol) was added, followed by sodium hydroxide (18.9M in water, 0.2 ml, 3.78 mmol). The reaction mixture was heated to reflux for 18 hours. The reaction mixture was cooled to ambient

25

- 33 -

temperature, and the solvent was evaporated *in vacuo*. The residue was partitioned between water (10 ml) and MTBE (10 ml) and the layers were separated. The aqueous phase was acidified to pH1 with 2M HCl (2.5 ml, 5 mmol) and MTBE (10 ml) was added to extract the product. The MTBE extract was dried over MgSO₄, and then evaporated *in vacuo* to afford a pale yellow oil (0.1g, 100% yield).

¹H NMR (400 MHz, CDCl₃) δ: 7.92 (d, 2H), 7.51 (m, 1H), 7.35 (m, 1H), 7.12 (d, 2H), 6.90 (m, 1H), 4.63 (m, 1H), 3.57 (m, 2H), 3.42 (s, 3H), 3.08 (s, 3H), 1.33 (d, 3H).

3-[(1S)-2-Methoxy-1-methylethoxy]-N-(1-methyl-1H-pyrazol-3-yl)-5-[4-(methylsulfonyl)phenoxy]benzamide

Diisopropylethylamine (2.5 equivalents) was added to a suspension of 3-[(1S)-2-methoxy-(1-methylethyl)oxy]-5-[[4-(methylsulfonyl)phenyl]oxy]benzoic acid (2.0g, 5.25mmol), *O*-(7-azabenzotriazol-1-yl)-N,N,N',N'-tetramethyluronium hexafluorophosphate (HATU, 2.5g, 6.6mmol) and 1-methyl-1H-pyrazol-3-amine (0.64g, 6.6mmol) in DMF (20 ml). The initial suspension dissolved into a dark orange solution. The resulting mixture was stirred at ambient temperature for 2 hours. The DMF was removed *in vacuo*, and the residue azeotroped with toluene. Water was added and the mixture extracted with ethyl acetate. The extracts were combined and washed sequentially with 1M hydrochloric acid, saturated sodium hydrogen carbonate solution and brine. The solution was dried (MgSO₄), filtered, and evaporated *in vacuo* to give the crude product which was chromatographed (50% ethyl acetate in isohexane) to give desired compound (25% yield), and recovered starting material.

- 34 -

3-[(1*S*)-2-Hydroxy-1-methylethoxy]-*N*-(1-methyl-1*H*-pyrazol-3-yl)-5-[4-(methylsulfonyl)phenoxy]benzamide

Trimethylsilyl iodide (11.06 ml, 76.25 mmol) was added to a solution of 3-[(1*S*)-2-methoxy-1-methylethoxy]-*N*-(1-methyl-1*H*-pyrazol-3-yl)-5-[4-(methylsulfonyl)phenoxy]benzamide (7.00 g, 15.25 mmol) in dry acetonitrile (100 ml) under argon for 21 h. Water (40 ml) was added to quench the reaction and the acetonitrile was removed in *vacuo*. The residue was diluted with ethyl acetate (200 ml) and 1M aqueous hydrochloric acid and the organic layer was separated and further washed with 10% w/v aqueous sodium thiosulfate pentahydrate to remove residual iodine. The organic layer was separated, dried (MgSO₄), filtered and evaporated and purified by column chromatography (eluting with 3% to 5% methanol: dichloromethane) to give the title compound (5.70 g, 84%) as a white foam. Recrystallisation from hot ethanol (125 mg/ml) afforded the title compound as colourless needles (87% recovery); ¹H NMR (300MHz, CDCl₃) δ: 1.33 (d, 3H), 2.10 (t, 1H), 3.08 (s, 3H), 3.78 (m, 2H), 3.82 (s, 3H), 4.57 (m, 1H), 6.80 (m, 2H), 7.15 (m, 3H), 7.25 (m, 2H), 7.93 (d, 2H), 8.43 (s, 1H); *m/z* 444 (M-H)⁺

Example 2:

This example illustrates formation of a compound of formula (VIII).

3-(3,5-Difluorophenoxy)-5-(2-methoxy-1-methylethoxy)benzoic acid.

3-(3,5-difluorophenoxy)-5-(2-methoxy-1-methylethoxy)benzonitrile (1.00 equiv; 9.40 mmol; 3.00 g) was charged to a 100ml round-bottomed flask (1 neck, condenser, magnetically stirred) with ethanol (515 mmol; 30.0 ml; 23.7 g). Water (138 mmol; 2.49 ml; 2.49 g), then sodium hydroxide (18.9M in water, 47.0 mmol; 2.49 ml; 3.75 g) was

- 35 -

charged and the mixture heated to reflux (bath temperature 90°C) for 4 hours. The mixture was cooled and solvent removed *in vacuo* affording a colourless solution (water not removed). The mixture was partitioned between water (50ml) and MTBE (50ml) and the layers separated (aqueous layer pH = 14). The aqueous phase was acidified with HCl solution (2M, aq, 50ml) and extracted with MTBE (50ml). The organic layer was dried over MgSO₄, filtered and the volatiles removed *in vacuo* affording 3-(3,5-difluorophenoxy)-5-(2-methoxy-1-methylethoxy)benzoic acid as a colourless oil (3.15g, 99%).

¹H NMR (400 MHz, CDCl₃) δ: 7.49 (m, 1H), 7.34 (m, 1H), 6.87 (m, 1H), 6.54 (m, 3H), 4.62 (m, 1H), 3.57 (m, 2H), 3.42 (s, 3H), 1.34 (d, 3H).

3-(3,5-Difluorophenoxy)-5-(2-methoxy-1-methylethoxy)benzonitrile.

3,5-Difluorophenol (2.00 equiv; 51.8 mmol; 6.74 g) was charged to a 100ml round-bottomed flask (3 necks, 2 stoppers, air condenser with argon inlet, magnetically stirred, oven dried) followed by NMP (471 mmol; 45.3 ml; 46.7 g) and cesium carbonate (51.8 mmol; 16.9 g). The mixture was sparged with argon for 10 minutes then cuprous monochloride (6.48 mmol; 641 mg), 2,2,6,6-tetramethyl-3,5-heptanedione, (1.30 mmol; 271 µl; 239 mg) and 3-bromo-5-(2-methoxy-1-methylethoxy)benzonitrile (1.00 equiv; 25.9 mmol; 7.00 g) were charged sequentially. The mixture was sparged with argon for 5 minutes then heated to 120°C and stirred for 24 hours. The reaction mixture was cooled and partitioned between HCl solution (1M, aqueous, 200 ml) and MTBE (200 ml). The layers were separated and the organic portion washed with NaOH solution (1M, aq, 200 ml), water (200 ml) and brine (200 ml). The resultant organic solution was dried over MgSO₄, filtered and the solvent removed *in vacuo* affording a brown oil. This material was purified by flash column chromatography affording 3-(3,5-difluorophenoxy)-5-(2-methoxy-1-methylethoxy)benzonitrile as a pale yellow oil (5.17g, 63%). ¹H NMR (400 MHz, CDCl₃) δ: 7.01 (s, 1H), 6.86 (m, 2H), 6.62 (m, 1H), 6.53 (m, 2H), 4.54 (m, 1H), 3.53 (m, 2H), 3.39 (s, 3H), 1.32 (d, 3H).

- 36 -

3-Bromo-5-(2-methoxy-1-methylethoxy)benzonitrile

- NaHMDS (148 mmol; 27.2 g) was charged to a 1000ml round-bottomed flask (4 necks, thermometer, pressure-equalising dropping funnel, stopper, nitrogen inlet, magnetically stirred, oven dried, nitrogen purged), followed by DMF (300ml). The mixture was stirred for 5 minutes then 1-methoxy-2-propanol (1.50 equiv; 148 mmol; 14.3 ml; 13.4 g) was added dropwise over a 10-minute period. The reaction temperature increased to 25°C. The mixture was cooled using a cold-water bath to 23°C, then 3-bromo-5-fluorobenzonitrile (1.00 equiv; 99.0 mmol; 20.0 g) in DMF (90ml) was added over a 5 minutes period (cold water bath still present). The mixture warmed to 27°C during addition, turning from yellow to brown. A line wash of DMF (10ml) was added. The mixture was stirred at ambient temperature for 30 minutes, then quenched by addition of HCl solution (2M, aqueous, 200ml), the dark brown reaction mixture turning pale yellow.
- The mixture was poured into water (400ml) and extracted with EtOAc (3x400ml). The combined organic extracts were washed with water (3x400ml) and dried over MgSO₄, filtered and the solvent removed *in vacuo* affording 3-bromo-5-(2-methoxy-1-methylethoxy)benzonitrile as an orange oil (25.38g, 95%). ¹H NMR (400 MHz, CDCl₃) δ: 7.32 (s, 1H), 7.26 (s, 1H), 7.11 (s, 1H), 4.58-4.55 (m, 1H), 3.59-3.48 (m, 2H), 3.41 (s, 3H), 1.33-1.31 (d, 3H).

Example 3:

- 37 -

Synthetic Route**3-[(1S)-2-tert-Butoxy-1-methylethoxy]-5-[4-(methanesulfonyl)phenoxy]benzonitrile**

5

- To a 3-necked round-bottomed flask (100 ml with condenser, septum thermometer and magnetic follower) was charged sodium hydride (32.96 mmol, 1.32 g). The flask was placed under an inert atmosphere and dry NMP (80 ml) was charged. To the resulting suspension was charged (S)-1-tert-butoxy-2-propanol (30.21 mmol; 3.99 g; added in 0.2ml aliquots with temperature control to control H₂ evolution). Once gas evolution had ceased 3-fluoro-5-(4-methanesulfonyl-phenoxy)benzonitrile (see Example 1, 27.46 mmol, 8.0 g) was added in one portion. The reaction mixture was heated to 70°C for 3 hours. The reaction was cooled to room temperature and toluene (240ml) was added followed by water (240 ml). The contents were stirred at room temperature for 30 minutes and then transferred to a separating funnel. The two layers were separated and the aqueous layer was further extracted with toluene (240 ml). The organic extracts were combined and washed once with sodium hydroxide (160 mmol, 160 ml) and then with water (4 x 160ml).

- 38 -

The toluene was removed *in vacuo* to leave an oil that slowly solidified (9.20 g; 83.02% yield).

¹H NMR (400 MHz, d-6 DMSO) δ: 7.92 (d, 2H) 7.33 (s, 1H); 7.23 (d, 2H); 7.19 (s, 1H); 7.07 (t, 1H); 4.62 (m, 1H); 3.44 (m, 2H); 3.19 (s, 3H); 1.21 (d, 3H); 1.07 (s, 9H).

5

3-[(1S)-2-*tert*-Butoxy-1-methylethoxy]-5-[4-(methylsulfonyl)phenoxy]benzoic acid

3-[(1S)-2-*tert*-Butoxy-1-methylethoxy]-5-[4-(methylsulfonyl)phenoxy]benzonitrile (23.7 mmol; 9.56 g) was dissolved in ethanol (95.60 ml), and transferred to a 250ml round bottomed flask, using ethanol (5 ml) to wash the residual solid from the flask. Water (6.25 ml) and sodium hydroxide (118.5 mmol; 6.30 ml) was added and the reaction was heated to reflux for 18 hours. The ethanol was removed *in vacuo*. The residual yellow suspension was dissolved in MTBE (162.5 ml) and water (162.5 ml). The two layers were separated, the MTBE layer was discarded and the aqueous layer was acidified with 2M HCl (100 ml). The aqueous layer was extracted twice with MTBE (162.5 ml). The organic extracts were combined and dried with magnesium sulfate, the MTBE was removed *in vacuo*, to give the desired product (7.0g, 69.9% yield).

¹H NMR (400 MHz, d-6 DMSO) δ: 7.92 (d, 2H), 7.32 (s, 1H), 7.21 (d, 2H), 7.10 (s, 1H), 7.00 (t, 1H), 4.53 (m, 1H), 3.42 (m, 2H), 3.19 (s, 3H), 1.22 (d, 3H), 1.09 (s, 9H).

20

- 39 -

3-[(1*S*)-2-*tert*-Butoxy-1-methylethoxy]-5-[4-(methylsulfonyl)phenoxy]benzoic acid

5

A solution of *tert*-butylamine was prepared by charging *tert*-butylamine (0.31 L, 2.94 mol) to a reaction vessel containing MTBE (2.27L). The solution was stirred at ambient temperature and then charged into a second reaction vessel containing 3-[(1*S*)-2-*tert*-butoxy-1-methylethoxy]-5-[4-(methylsulfonyl)phenoxy]benzoic acid (1.13 Kg, 267 mol) and MTBE (2.54 L). The temperature was maintained between 20-30°C during the addition, the residual *tert*-butylamine was washed in with MTBE (0.57 L). The reaction mixture was heated to 38-40°C for 3 hours under a nitrogen atmosphere. The reaction mixture was cooled to 18-25°C over 1-2 hours and then held until crystallisation occurred. The product was isolated by filtration washed twice with MTBE (2.28 L), and dried in a vacuum oven at 38-40°C. This resulted in (1.32 Kg, 100% yield) of the title compound.

15

¹H NMR (400 MHz, CDCl₃) δ 7.86 (d, 2H), 7.47 (s, 1H), 7.26 (s, 1H), 7.08 (d, 2H), 6.74 (t, 1H), 4.45 (sextet, 1H), 3.56 (dd, 1H), 3.37 (dd, 1H), 3.04 (s, 3H), 1.30 (d, 3H), 1.25 (s, 9H), 1.16 (s, 9H)

3-[(1*S*)-2-*tert*-Butoxy-1-methylethoxy]-5-[4-(methylsulfonyl)phenoxy]benzoic acid

Aqueous citric acid was prepared by dissolving citric acid (7.35 g, 38.25 mmol) in water (100 mL). The aqueous citric acid solution was added to a reaction vessel containing (3-

- 40 -

[(1*S*)-2-*tert*-butoxy-1-methylethoxy]-5-[4-(methylsulfonyl)phenoxy]benzoyl oxy)(*tert*-butyl)ammonium (10 g at 94.6%w/w, 19.13 mmol) and MTBE (80 mL). The two-phase mixture was stirred for 30 minutes at ambient temperature. The two phases were separated, and the aqueous phase was extracted with MTBE (80 mL). The two organic phases were combined and washed three times with brine (3 x 80 mL), followed by water (2 x 80 mL). The combined MTBE extract was distilled down to low volume, fresh MTBE (80 mL) was added and the mixture was distilled down to low volume. Acetonitrile (120 mL) was added and the mixture was distilled down to low volume at 50°C, 209mbar. This azeodrying was repeated once more to provide a dry acetonitrile solution of the title compound, which was used directly in the next stage.

¹H NMR (400 MHz, CDCl₃) δ 7.91 (d, 2H), 7.54 (s, 1H), 7.33 (s, 1H), 7.12 (d, 2H), 6.91 (t, 1H), 4.53 (sextet, 1H), 3.58 (dd, 1H), 3.43 (dd, 1H), 3.07 (s, 3H), 1.34 (d, 3H), 1.19 (s, 9H)

15 3-[(1*S*)-2-*tert*-Butoxy-1-methylethoxy]-*N*-(1-methyl-1*H*-pyrazol-3-yl)-5-[4-(methylsulfonyl)phenoxy]benzamide

20 1,1'-Carbonyldiimidazole (CDI) (7.44 mmol, 1.21 g) was charged to a 25ml 3-necked round bottomed flask (equipped with condenser, nitrogen line, magnetic stirrer, thermometer, and septum). The flask was placed under an inert atmosphere and THF (160.9 mmol, 13.1 ml) was added. 3-[(1*S*)-2-*tert*-Butoxy-1-methylethoxy]-5-[4-(methylsulfonyl)phenoxy] benzoic acid (6.20 mmol, 2.62 g) was dissolved in THF (10.48 ml) and added to the flask in 2ml aliquots over 5 minutes, then washed in using further THF (5 ml). The solution was stirred at room temperature for 1 hour. The reaction temperature was increased to 60°C and 3-amino 1-methyl pyrazole (6.82 mmol; 662.2 ml)

- 41 -

dissolved in toluene (13.1 ml) was added to the reaction in one portion then washed in using further toluene (4 ml). The reaction was held at 60°C for 18 hours. The solvent was removed *in vacuo* to leave a thick yellow oil, MTBE (100 ml) and sodium hydroxide (1M, 50 ml) were added, the two layers were separated and the organic layer was washed with sodium hydroxide (1M, 20 ml) followed by HCl (2M, 30 ml). The organic layer was dried with magnesium sulfate and the solvent was removed *in vacuo* to give a thick yellow oil. A small quantity was purified using flash column chromatography (eluent 80% isopropyl acetate:20% *iso*-hexane) to give the desired product.

¹H NMR (400 MHz, d-6 DMSO) δ : 10.89 (s, 1H), 7.96 - 7.92 (m, 2H), 7.60 (d, 1H), 7.50 (s, 1H), 7.29 (s, 1H), 7.27 - 7.21 (m, 2H), 6.91 (t, 1H), 6.56 (d, 1H), 4.64 - 4.54 (m, 1H), 3.78 (s, 3H), 3.60 - 3.46 (m, 2H), 3.21 (s, 3H), 1.24 (d, 3H).

An alternative procedure:

To a dry 1L-jacketed vessel under nitrogen atmosphere was charged acetonitrile (250 mL). Overhead stirring was commenced and the reaction warmed to 25°C. Once the reaction reached the required temperature CDI (149.11 mmol, 24.18 g) was charged to the reactor. A 39.8%w/w solution of 3-[(1*S*)-2-*tert*-butoxy-1-methylethoxy]-5-[4-(methylsulfonyl)phenoxy]benzoic acid in acetonitrile was then charged to the reaction as a constant flow over 90 minutes. Completion of this addition was followed by addition of a line wash of acetonitrile (50 mL). The resulting solution was then stirred at 25°C for 30 minutes.

The reaction temperature was then increased to 60°C and 3-amino 1-methyl pyrazole (117.51mmol, 17.24g) dissolved in acetonitrile (50 mL) was charged to the reaction in one portion followed by an acetonitrile (50mL) line wash. The reaction was held at 60°C for 18 hours. HPLC analysis found the solution to contain 11.71%w/w of the required amide product. This represented a 91% yield (53.78g; 100.72mmol) of the title compound. The solution was used directly in the following reaction without isolation of the product.

¹H NMR (400 MHz, DMSO) 10.89 (s, 1H, NH), 7.96 - 7.92 (m, 2H), 7.60 (d, 1H), 7.50 (m, 1H), 7.30 (m, 1H), 7.26 - 7.22 (m, 2H), 6.91 (t, 1H), 6.56 (d, 1H), 4.70 - 4.62 (m, 1H), 3.78 (s, 3H), 3.60 - 3.46 (m, 2H), 3.21 (s, 3H), 1.25 (d, 3H).

- 42 -

3-[(1*S*)-2-Hydroxy-1-methylethoxy]-*N*-(1-methyl-1*H*-pyrazol-3-yl)-5-[4-(methylsulfonyl)phenoxy]benzamide

5

To a 25ml round-bottomed flask was charged 3-[(1*S*)-2-*tert*-butoxy-1-methylethoxy]-*N*-(1-methyl-1*H*-pyrazol-3-yl)-5-[4-(methylsulfonyl)phenoxy]benzamide (498.4 μ mol, 250.0 mg). This was dissolved in methanol (4 ml) and HCl (4 ml) was added to the flask in one portion. The reaction was heated to 50°C for 1.5 hours. Solvent was removed *in vacuo* to yield a colourless solid that quickly changed to liquid form on standing. The liquid was dissolved in ⁱPrOAc (10 ml) and water (10 ml). The aqueous layer was extracted with further ⁱPrOAc (10 ml). The combined organic layer was dried with MgSO₄ and the solvent was removed *in vacuo* to yield crude title product (142 mg; 63.95% yield) as a white foamy solid.

15 A sample of this material (110 mg) was dissolved in ethanol (0.5 ml) and then heated to reflux. The solution was then cooled to room temperature and a small spatula of the product was added at 45-50°C to provide a seed to aid recrystallisation. After several days stirring, the recrystallised solid was isolated by filtration to yield the desired product as a crystalline solid (50 mg, 45% yield).

20 ¹H NMR (400 MHz, d-6 DMSO) δ : 10.89 (s, 1H), 7.97 - 7.92 (m, 2H), 7.60 (d, 1H), 7.50 (s, 1H), 7.30 (s, 1H), 7.27 - 7.22 (m, 2H), 6.91 (t, 1H), 6.57 (d, 1H), 4.88 (t, 1H), 4.63 - 4.55 (m, 1H), 3.77 (s, 3H), 3.60 - 3.52 (m, 1H), 3.21 (s, 3H), 1.24 (d, 3H)

An alternative procedure:

25

- 43 -

3-[(1S)-2-Hydroxy-1-methylethoxy]-N-(1-methyl-1H-pyrazol-3-yl)-5-[4-(methylsulfonyl)phenoxy]benzamide hydrochloride

- 5 A solution of 3-[(1S)-2-*tert*-butoxy-1-methylethoxy]-N-(1-methyl-1H-pyrazol-3-yl)-5-[4-(methylsulfonyl)phenoxy]benzamide (456.32 g of an 11.41% w/w solution in acetonitrile; 103.80 mmol) was charged to a jacketed vessel. The stirred mixture was heated to between 93°C and 101°C (jacket temperature) and solvent was removed by distillation under atmospheric pressure until a total of 370 mL of distillate was collected. The mixture
- 10 was then cooled (jacket temperature 30°C) and MTBE (500 mL) was added to give a cloudy mixture. The jacket temperature was set to 20°C and aqueous hydrochloric acid (250 mL of a 2.10M solution) was added when the temperature of the reaction mixture reached 23.6°C. The mixture was stirred for 10 minutes then separated. The upper organic layer washed with water (250 mL) and the layers were separated. The retained organic
- 15 layer was heated (jacket temperature 68°C) and solvent removed by distillation under atmospheric pressure until a total of 440 mL of distillate was collected. Isopropyl alcohol (300 mL) was then added to the mixture in the vessel. The jacket temperature was set to 95°C and solvent removed by distillation under atmospheric pressure until a total of 250mL of distillate was collected. The mixture was cooled to between 20 and 21°C and a
- 20 solution of hydrogen chloride (5.52 M in isopropanol, 616 mL) was added. The mixture was heated to 50°C over 40 minutes. The mixture was maintained at 50°C for a further 70 minutes before addition of a seed of 3-[(1S)-2-hydroxy-1-methylethoxy]-N-(1-methyl-1H-pyrazol-3-yl)-5-[4-(methylsulfonyl)phenoxy]benzamide (66mg). The mixture was stirred for a further 15 min then seeded once more (53mg). The mixture was set on a pre-
- 25 programmed cooling ramp to 15°C over 400 min. The product started to crystallise approximately 40 minutes after initiation of the cooling profile. After stirring for approximately 20 hours after initiation of the cooling ramp, the crystallised product was

- 44 -

collected by filtration. The collected solid was washed with MTBE (150 mL). The product cake was sucked dry on the filter then subjected to further drying in vacuum for approximately 18 hours at 45°C to give the title product (40.52g; with a purity of 94.22% w/w by HPLC assay (73.4% yield after correction for assay)).

- 5 ¹H NMR (400 MHz, DMSO) δ 10.90 (s, 1H), 7.97 - 7.91 (m, 2H), 7.60 (d, 1H), 7.50 (s, 1H), 7.30 (s, 1H), 7.27 - 7.22 (m, 2H), 6.91 (t, 1H), 6.56 (d, 1H), 5.52 (br s), 4.64 - 4.55 (m, 1H), 3.77 (s, 3H), 3.61 - 3.45 (m, 2H), 3.21 (s, 3H), 1.24 (d, 3H)

10 3-[(1S)-2-Hydroxy-1-methylethoxy]-N-(1-methyl-1H-pyrazol-3-yl)-5-[4-(methylsulfonyl)phenoxy]benzamide

- 15 3-[(1S)-2-Hydroxy-1-methylethoxy]-N-(1-methyl-1H-pyrazol-3-yl)-5-[4-(methylsulfonyl)phenoxy]benzamide hydrochloride (2907.8 g, 6.03 mol) and ethyl acetate (30 L) were charged to the reaction vessel and stirred to give a thick cream slurry. Saturated aqueous sodium hydrogen carbonate solution (7.3 L) was charged to the reaction over at least 15 minutes (to control gas evolution). The mixture was stirred for at least 30 minutes until the solid had dissolved to give a clear solution. The aqueous
- 20 phases was removed and discarded, the organic phase was washed with water (14.6 L), and screened into the crystallising vessel. The reaction mixture was azeo-dried by distillation; the ethyl acetate solution was distilled from 31.0 L down to 14.5 L, fresh ethyl acetate (14.5 L) was added and the distillation was repeated until there was 14.5 L of ethyl acetate remaining in the reaction vessel. The reaction mixture was cooled to 45°C at –
- 25 0.4°C/minute, and then held at 45°C for 18 hours. The reaction mixture was seeded, MTBE (29 L) was added to the reaction mixture over ~1 hour, maintaining the reaction temperature at 45°C; the mixture was then stirred at this temperature for 3 hours prior to

- 45 -

cooling to 20°C at -0.4°C/min. The mixture was held at 20°C for 18 hours, the product was then isolated by filtration and washed with MTBE (6.0 L) and dried in a vacuum oven at 40°C. This resulted in 2216 g (82% yield) of the title product.

¹H NMR (400 MHz, DMSO) δ 10.86 (s, 1H), 7.91 (d, 2H), 7.56 (d, 1H), 7.47 (s, 1H),
5 7.26 (s, 1H), 7.20 (d, 2H), 6.88 (t, 1H), 6.53 (d, 1H), 4.85 (t, 1H), 4.55 (sextet, 1H), 3.73 (s, 3H), 3.57 - 3.42 (m, 2H), 3.17 (s, 3H), 1.20 (d, 3H)

¹³C NMR (100MHz, DMSO) δ 162.98, 160.80, 159.46, 155.85, 146.78, 136.76, 135.15, 130.89, 129.59, 118.19, 111.07, 110.91, 110.79, 97.41, 75.09, 64.08, 43.74, 38.29, 16.38

Claims

1. A process for making a compound of formula (I),

5

said process comprising

- a) reaction of a compound of formula (II)

- 10 wherein X¹ is carboxyl or a precursor thereof, X² is F and X³ is selected from F, Br and OH;

with:

- i) a compound of formula (III) by nucleophilic aromatic substitution of X² using a suitable base in a suitable solvent,

15

wherein X is as defined for formula (I) below and R¹ is selected from methyl, methoxymethyl and hydroxymethyl (or a protected version thereof); and

- 20 ii) a compound of formula (IV) by nucleophilic aromatic substitution using a suitable base in a suitable solvent, or, when X³ is Br, under conditions suitable for an Ullman ether reaction,

- 50 -

(IV)

wherein R^2 , R^3 , m and n are as defined for formula (I) and X^4 is OH when X^3 is F or Br, and X^4 is a leaving group when X^3 is OH;

- 5 b) where necessary, conversion of X^1 into a carboxylic acid; and
- c) coupling of the carboxylic acid group to a compound of formula (V);

(V)

and thereafter if necessary:

- 10 i) converting a compound of formula (I) into another compound of formula (I);
 - ii) where R^1 is a protected version of hydroxymethyl, removal of the protecting group;
 - iii) forming a pro-drug; and/or
 - iv) forming a pharmaceutically acceptable salt;
- wherein in a compound of formula (I):
- 15 R^1 is hydroxymethyl, methoxymethyl or methyl;
 - X is methyl or ethyl;
 - R^2 is selected from $-C(O)NR^4R^5$, $-SO_2NR^4R^5$, $-S(O)_pR^4$ and HET-2;
 - HET-1 is a 5- or 6-membered, C-linked heteroaryl ring containing a nitrogen atom in the 2-position and optionally 1 or 2 further ring heteroatoms independently selected from O, N
 - 20 and S; which ring is optionally substituted on an available carbon atom, or on a ring nitrogen atom provided it is not thereby quaternised, with 1 or 2 substituents independently selected from R^6 ;
 - HET-2 is a 4-, 5- or 6-membered, C- or N-linked heterocyclyl ring containing 1, 2, 3 or 4 heteroatoms independently selected from O, N and S, wherein a $-CH_2-$ group can
 - 25 optionally be replaced by a $-C(O)-$, and wherein a sulphur atom in the heterocyclic ring may optionally be oxidised to a $S(O)$ or $S(O)_2$ group, which ring is optionally substituted

- 51 -

on an available carbon or nitrogen atom by 1 or 2 substituents independently selected from R^7 ;

R^3 is selected from halo, fluoromethyl, difluoromethyl, trifluoromethyl, methyl, methoxy and cyano;

- 5 R^4 is selected from hydrogen, (1-4C)alkyl [optionally substituted by 1 or 2 substituents independently selected from HET-2, $-OR^5$, $-SO_2R^5$, (3-6C)cycloalkyl (optionally substituted with 1 group selected from R^7) and $-C(O)NR^5R^5$], (3-6C)cycloalkyl (optionally substituted with 1 group selected from R^7 and HET-2);

R^5 is hydrogen or (1-4C)alkyl;

- 10 or R^4 and R^5 together with the nitrogen atom to which they are attached may form a heterocyclyl ring system as defined by HET-3;

R^6 is independently selected from (1-4C)alkyl, halo, hydroxy(1-4C)alkyl, (1-4C)alkoxy(1-4C)alkyl, (1-4C)alkylS(O)p(1-4C)alkyl, amino(1-4C)alkyl, (1-4C)alkylamino(1-4C)alkyl, di(1-4C)alkylamino(1-4C)alkyl and HET-4;

- 15 or, when HET-1 is 2-pyridyl, R^6 may additionally be carboxy;

R^7 is selected from $-OR^5$, (1-4C)alkyl, $-C(O)(1-4C)alkyl$, $-C(O)NR^4R^5$, (1-4C)alkoxy(1-4C)alkyl, hydroxy(1-4C)alkyl and $-S(O)pR^5$;

HET-3 is an N-linked, 4 to 6 membered, saturated or partially unsaturated heterocyclyl ring, optionally containing 1 or 2 further heteroatoms (in addition to the linking N atom)

- 20 independently selected from O, N and S, wherein a $-CH_2-$ group can optionally be replaced by a $-C(O)-$ and wherein a sulphur atom in the ring may optionally be oxidised to a S(O) or S(O)₂ group; which ring is optionally substituted on an available carbon or nitrogen atom by 1 or 2 substituents independently selected from R^8 ; or

HET-3 is an N-linked, 7 membered, saturated or partially unsaturated heterocyclyl ring,

- 25 optionally containing 1 further heteroatom (in addition to the linking N atom) independently selected from O, S and N, wherein a $-CH_2-$ group can optionally be replaced by a $-C(O)-$ group and wherein a sulphur atom in the ring may optionally be oxidised to a S(O) or S(O)₂ group; which ring is optionally substituted on an available carbon or nitrogen atom by 1 or 2 substituents independently selected from R^8 ; or

- 30 HET-3 is an 6-10 membered bicyclic saturated or partially unsaturated heterocyclyl ring, optionally containing 1 further nitrogen atom (in addition to the linking N atom), wherein a

- 52 -

-CH₂- group can optionally be replaced by a -C(O)-; which ring is optionally substituted on an available carbon or nitrogen atom by 1 substituent selected from hydroxy and R³;

R⁸ is selected from -OR⁵, (1-4C)alkyl, -C(O)(1-4C)alkyl, -C(O)NR⁴R⁵, (1-4C)alkylamino, di(1-4C)alkylamino, HET-3 (wherein said ring is unsubstituted), (1-4C)alkoxy(1-4C)alkyl, hydroxy(1-4C)alkyl and -S(O)pR⁵;

HET-4 is a 5- or 6-membered, C- or N-linked unsubstituted heteroaryl ring containing 1, 2 or 3 ring heteroatoms independently selected from O, N and S;

p is (independently at each occurrence) 0, 1 or 2;

m is 0 or 1; and

10 n is 0, 1 or 2;

provided that when m is 0, then n is 1 or 2.

2. A process as claimed in Claim 1, wherein in the compound of formula (I), R¹ is hydroxymethyl or methoxymethyl; and X is methyl.

15

3. A process as claimed in Claim 1 or Claim 2, wherein in the compound of formula (I), m is 1, n is 0 and R² is methylsulfonyl.

4. A process as claimed in Claim 1, wherein the compound of formula (I) is a compound of formula (Ia)

20

Formula (Ia)

wherein:

R³ is selected from fluoro, chloro, C₁₋₃alkyl and C₁₋₃alkoxy;

25 R¹ is selected from methyl and methoxymethyl;

n is 0, 1 or 2;

X is methyl.

- 53 -

5. A process as claimed in Claim 1 wherein step a(i) is carried out before step a(ii) such that the sequence of reactions comprises:

5

6. A process as claimed in Claim 1 wherein step a(ii) is carried out before step a(i) such that the sequence of reactions comprises:

7. A process as claimed in Claim 1, which is a process for making a compound of formula (Ib), said process comprising:
- reaction of difluorobenzonitrile (IIa) with 4-methanesulfonylphenol to give the compound of formula (VIIa);
 - reaction of the compound of formula (VIIa) with the compound of formula (IIIa) (wherein R^{1a} is methoxymethyl, hydroxymethyl or a protected version thereof) to give the compound of formula (VIIIa);
 - hydrolysis of the nitrile to give the compound of formula (VIIIb); reaction with a heterocyclic amine to give the compound of formula (Ib); and thereafter if necessary:
- converting a compound of formula (Ib) into another compound of formula (Ib);
 - where R^{1a} is a protected version of hydroxymethyl, removal of the protecting group;

- 54 -

- iii) forming a pro-drug; and/or
iv) forming a pharmaceutically acceptable salt;

5

8. A process as claimed in Claim 7, wherein R^{1a} is methoxymethyl or tertbutoxymethyl.

9. A process as claimed in Claim 7 or Claim 8, wherein HET-1 is pyrazolyl,
10 optionally substituted with (1-4C)alkyl.

10. A process as claimed in any one of Claims 7 to 9 wherein the compound (VIIIb) is isolated as a salt.

11. A process as claimed in any one of Claims 7 to 10 wherein the compound of formula (Ib), wherein R^{1a} is methoxymethyl or tertbutoxymethyl, is subsequently converted to a compound of formula (Ib) wherein R^{1a} is hydroxymethyl.

12. A process as claimed in Claim 11 wherein the compound of formula (VIIIb) is
20 converted to the compound of formula (Ib) (wherein R^{1a} is hydroxymethyl) without

- 55 -

isolation of the intermediate compound of formula (Ib) (wherein R^{1a} is methoxymethyl or tertbutoxymethyl).

13. A compound of formula (VII) as defined in Claim 6 which is
5 3-fluoro-5-[4-(methanesulfonyl)phenoxy]benzonitrile.
14. A compound of formula (VIII) as defined in Claim 5 which is a compound selected from:
3-[(1*S*)-2-methoxy-1-methylethoxy]-5-[4-(methylsulfonyl) phenoxy] benzonitrile [and the
10 racemic version];
3-[(1*S*)-2-*tert*-butoxy-1-methylethoxy]-5-[4-(methylsulfonyl)phenoxy]benzonitrile;
3-[(1*S*)-2-*tert*-butoxy-1-methylethoxy]-5-[4-(methylsulfonyl)phenoxy]benzoic acid;
morpholine salt of 3-[(1*S*)-2-*tert*-butoxy-1-methylethoxy]-5-[4-
(methylsulfonyl)phenoxy]benzoic acid;
15 *tert*-butylamine salt of 3-[(1*S*)-2-*tert*-butoxy-1-methylethoxy]-5-[4-
(methylsulfonyl)phenoxy]benzoic acid.
15. The compound 3-[(1*S*)-2-*tert*-butoxy-1-methylethoxy]-*N*-(1-methyl-1*H*-pyrazol-3-
yl)-5-[4-(methylsulfonyl)phenoxy]benzamide.
20
16. A compound of formula (I) obtainable by the process of Claim 1.
17. The compound of claim 16 which is a compound selected from:
3-[(1*S*)-2-*tert*-butoxy-1-methylethoxy]-*N*-(1-methyl-1*H*-pyrazol-3-yl)-5-[4-
25 (methylsulfonyl)phenoxy]benzamide;
3-[(1*S*)-2-hydroxy-1-methylethoxy]-*N*-(1-methyl-1*H*-pyrazol-3-yl)-5-[4-
(methylsulfonyl)phenoxy]benzamide; and
3-[(1*S*)-2-methoxy-1-methylethoxy]-*N*-(1-methyl-1*H*-pyrazol-3-yl)-5-[4-
(methylsulfonyl)phenoxy]benzamide.
